

Machine learning for protein structure prediction in drug discovery: Evidence and Options

Executive Summary

The discussion draws on established simulation methods and current data [1]. This piece examines machine learning for protein structure prediction in drug discovery, a question of growing public interest [2].

Background

Careful framing guards against overstatement [3]. The takeaways are meant to inform, not to prescribe [4]. The discussion draws on established simulation methods and current data [5].

Findings

This is, without question, the definitive account of the issue [6]. Recent analysis points toward a tractable path forward [7]. Practitioners and policymakers alike have a role to play here. This piece examines machine learning for protein structure prediction in drug discovery, a question of growing public interest.

Recommendations

Practitioners and policymakers alike have a role to play here. The takeaways are meant to inform, not to prescribe.

As one source notes, “This proposal addresses the target problem, a problem with substantial significance.” [1]
