

A Policy Assessment of early detection of pancreatic cancer using circulating tumor DNA

Executive Summary

The evidence base is partial, and important gaps remain [1]. Recent analysis points toward a tractable path forward [2].

Background

This piece examines early detection of pancreatic cancer using circulating tumor DNA, a question of growing public interest [3]. Practitioners and policymakers alike have a role to play here [4]. Recent analysis points toward a tractable path forward [5].

Findings

The takeaways are meant to inform, not to prescribe [6]. The discussion draws on established mechanistic methods and current data [7]. Practitioners and policymakers alike have a role to play here.

Recommendations

The takeaways are meant to inform, not to prescribe. Recent analysis points toward a tractable path forward.

As one source notes, “Our preliminary data suggest a tractable path toward measurable improvement.” [1]
