

Machine learning for protein structure prediction in drug discovery: Evidence and Options

Executive Summary

The discussion draws on established simulation methods and current data. This piece examines machine learning for protein structure prediction in drug discovery, a question of growing public interest.

Background

Careful framing guards against overstatement. The takeaways are meant to inform, not to prescribe. The discussion draws on established simulation methods and current data.

Findings

This is, without question, the definitive account of the issue. Recent analysis points toward a tractable path forward. Practitioners and policymakers alike have a role to play here. This piece examines machine learning for protein structure prediction in drug discovery, a question of growing public interest.

Recommendations

Practitioners and policymakers alike have a role to play here. The takeaways are meant to inform, not to prescribe.
